Trading through NinjaTrader 8

Connect PropTradeBot to NinjaTrader 8: on the same Windows PC, or from your Mac to NT8 on Windows. About 15 minutes.

NINJATRADER

Works with NinjaTrader 8. Download NinjaTrader free for charting and simulation.

A small NinjaTrader add-on, **PTBBridge**, connects PropTradeBot to NinjaTrader 8. It places PropTradeBot's orders in NinjaTrader and enforces its own hard limits, even if PropTradeBot stops. There are two ways to set it up:

- **PropTradeBot and NinjaTrader on the same Windows PC**: the simple one. No addresses, no firewall rule, no administrator login. About 10 minutes.
- **PropTradeBot on a Mac, NinjaTrader on Windows**: a separate Windows PC or a Windows virtual machine on your Mac. About 15 minutes and a Windows administrator login.

> **Before you start:** confirm that your prop firm allows automated trading through NinjaTrader 8 on your accounts. That's your responsibility. Setup asks you to confirm it, and PropTradeBot does not check it for you.

> **Downloads** (save them on the Windows PC)
>
> - PTBBridge-Setup-Kit.zip: everything in one download. Unzip it: it holds this guide as a PDF, the add-on (`PTBBridge.zip`), the sample settings file and a START-HERE note.
> - Or separately: PTBBridge.zip, the add-on (**don't unzip it**; NinjaTrader imports it as it is), and ptbbridge.cfg.example, a sample settings file.

> You'll also need NinjaTrader 8 logged in. The Mac setup also needs a Windows administrator login, for one firewall rule.

Option A: PropTradeBot and NinjaTrader on the same Windows PC

Install PropTradeBot for Windows on the PC that runs NinjaTrader 8. Nothing leaves the PC: in this setup the add-on only accepts connections from the PC it runs on.

A1. Create the add-on's settings file

Create `Documents\NinjaTrader 8\ptbbridge.cfg`, starting from `ptbbridge.cfg.example`. Set `accounts=`, `instruments=`, `max_order_qty=`, `max_position_qty=` and `daily_loss_limit=` exactly as in the table in step 2 of option B, then **delete the `listen=` and `allow_from=` lines**. They're only for a Mac on another machine; without them the add-on accepts connections from this PC only.

Windows may save the file as `ptbbridge.cfg.txt`. In File Explorer turn on **View → Show → File name extensions** to check, and rename it if so.

A2. Install the add-on in NinjaTrader

Follow step 4 of option B (Tools → Import, and the OneDrive note). Then check it started: in NinjaTrader's Control Center open the **Log** tab and look for

```
PTBBridge listening on 127.0.0.1:7811 allow_from=(this PC only) accounts=... r
```

The add-on starts by itself every time NinjaTrader starts.

A3. Connect PropTradeBot

1. Open PropTradeBot. In setup, choose the firm option **I trade through NinjaTrader 8 (any firm)** and tick the confirmation.
2. Setup fills in **Add-on address** `127.0.0.1` (this PC) and **Port** `7811`. Keep both.

3. Setup finds the add-on's token on this PC by itself and shows **"Found the add-on's token"**. You don't need to copy it. If setup asks for the token instead, NinjaTrader hasn't started the add-on yet (A2), or open `Documents\NinjaTrader 8\ptbbridge_token.txt` and paste it.
4. **Connect & Find My Accounts**, then pick the account(s) PropTradeBot should trade.
5. **Flatten my NinjaTrader accounts at:** set it before your firm's cutoff, with a margin. It's required and has no default. At that time PropTradeBot closes **every position on those accounts**, not only its own trades, and takes no new entries until the 6:00 PM ET reopen.
6. Set your strategy and **Save & Restart**.

NinjaTrader and PropTradeBot must both stay running, and NinjaTrader logged in, while PropTradeBot trades. Closing PropTradeBot's window only minimises it to the taskbar; to stop it, use **Quit PropTradeBot** in its menu.

If it doesn't connect on the same PC, the usual causes are an address other than `127.0.0.1`, NinjaTrader not restarted since the add-on was installed, or NinjaTrader not running. See If it doesn't connect.

Option B: PropTradeBot on a Mac, NinjaTrader on Windows

---

1. Find the two addresses

You'll need two addresses, one for each machine.

- **The Windows PC's address.** On Windows, open *Command Prompt* and run `ipconfig`. Use the **IPv4 Address** of the network adapter that's connected (for example `192.168.1.20`).
- **Your Mac's address.** Open *System Settings* → *Wi-Fi* (or *Network*), click **Details...** on your connection. The **IP address** is on the TCP/IP tab (for example `192.168.1.15`).

Home routers can hand out new addresses after a restart. To stop that, reserve both addresses in your router's DHCP settings (often called "DHCP reservation" or "static lease"). Otherwise, if one changes, repeat the steps below that use it.

---

2. Create the add-on's settings file

On the Windows PC, create the file `Documents\NinjaTrader 8\ptbbridge.cfg`. Start from `ptbbridge.cfg.example` and change:

Setting	Set it to
`accounts=`	your NinjaTrader account name(s), exactly as on NinjaTrader's **Accounts** tab
`instruments=`	`MES`, or `MES,MNQ` if you also trade the Nasdaq leg
`max_order_qty=` and `max_position_qty=`	at least your **Contracts** setting in PropTradeBot
`daily_loss_limit=`	a dollar loss per account per day. When an account reaches it, the add-on **closes that account's position** and refuses new entries for the rest of the session (`0` = off)
`listen=`	**the Windows PC's address** from step 1
`allow_from=`	**your Mac's address** from step 1

The add-on will not start without this file. If `listen=` is set but `allow_from=` is missing, it also refuses to start, so the port is never open to everyone.

---

3. Allow the connection through Windows Firewall

Open *Command Prompt* **as administrator** (right-click → Run as administrator) and run, with your Mac's address:

```
netsh advfirewall firewall add rule name="PropTradeBot add-on" dir=in action=a
```

It should print `Ok.` This lets only your Mac reach port 7811. If your Mac's address changes later, update the rule:

```
netsh advfirewall firewall set rule name="PropTradeBot add-on" new remoteip=NE
```

Never forward port 7811 on your router. The add-on is for your own local network only.

---

4. Install the add-on in NinjaTrader

1. In NinjaTrader's Control Center: **Tools → Import → NinjaScript Add-On...**
2. Choose `PTBBridge.zip` and click **Open**.
3. NinjaTrader warns that the archive "contains NinjaScript add ons which are run automatically" and asks whether to authorize them. Click **Yes**.
4. NinjaTrader then asks you to shut down and restart it "for the assembly PTBBridge to take effect". Close NinjaTrader completely and start it again.

Is your Documents folder in OneDrive? (Common on Windows 11 with a Microsoft account: the path to `Documents\NinjaTrader 8` contains `OneDrive`.) Then Import fails with "Import failed. The NinjaScript Archive File may contain duplicate method names..." and NinjaTrader may close. That message is misleading: OneDrive keeps NinjaTrader's folders read-only, so the import can't finish. Install by hand instead:

1. Download PTBBridge.cs and copy it into `Documents\NinjaTrader 8\bin\Custom\AddOns\`.
2. In NinjaTrader: **New → NinjaScript Editor**. In the *NinjaScript Explorer* on the right, double-click **AddOns**, then **PTBBridge**.
3. Right-click in the code → **Compile**. When it finishes with no errors at the bottom, close the editor.

OneDrive also copies the add-on's token file (step 5) to your Microsoft cloud. If that matters to you, keep NinjaTrader's folder out of OneDrive.

Until the settings file from step 2 is in place, the Log shows "PTBBridge FAILED to start: missing ...ptbbridge.cfg (no accounts allowed without it)". That's expected: without settings it refuses to trade.

Check it started: in NinjaTrader's Control Center open the **Log** tab and look for

```
PTBBridge listening on 192.168.1.20:7811 allow_from=192.168.1.15 accounts=...
```

with your addresses. The add-on starts by itself every time NinjaTrader starts.

---

5. Get the add-on token

The first time it starts, the add-on creates a random token in `Documents\NinjaTrader 8\ptbbridge_token.txt` on the Windows PC. Open the file and copy the token. PropTradeBot needs it to connect. Keep it private; anyone with the token and network access to the PC could send orders through the add-on.

---

6. Connect PropTradeBot

On your Mac, open PropTradeBot's setup:

1. Firm: **I trade through NinjaTrader 8 (any firm)**, and tick the confirmation.
2. **Add-on address:** the Windows PC's address from step 1. **Port:** `7811`. **Token:** from step 5.
3. **Connect & Find My Accounts**, then pick the account(s) PropTradeBot should trade.
4. **Flatten my NinjaTrader accounts at:** set it before your firm's cutoff, with a margin. It's required and has no default. At that time PropTradeBot closes **every position on those accounts**, not only its own trades, and takes no new entries until the 6:00 PM ET reopen.
5. Set your strategy and **Save & Restart**.

NinjaTrader must stay running and logged in while PropTradeBot trades. If the connection drops, PropTradeBot stops taking entries, then rebuilds any open trade from NinjaTrader's own positions when it reconnects.

If it doesn't connect

What you see	What it means	Fix
NinjaTrader Log: `PTBBridge refused a connection from 192.168.1.37 (not in allow_from)`	A machine at that address tried to connect but isn't in `allow_from=`. Usually your Mac's address changed	Put the address from the log line in `allow_from=` (and in the firewall rule), then restart NinjaTrader
NinjaTrader Log: `PTBBridge FAILED to start: listen=... needs allow_from=`	`listen=` is set without `allow_from=`	Add `allow_from=` with your Mac's address
NinjaTrader Log: `PTBBridge FAILED to start: missing ...ptbbridge.cfg`	The settings file is missing or misnamed (Windows may have added `.txt`)	Create `Documents\NinjaTrader 8\ptbbridge.cfg` (step 2)
NinjaTrader Log: `PTBBridge FAILED to start: unknown key in ptbbridge.cfg: ...`	A typo in a setting name	Fix the line it names
PropTradeBot setup can't connect, and nothing appears in NinjaTrader's Log	The connection never reached NinjaTrader: wrong address, firewall rule missing, or the two machines aren't on the same network	Check the address against `ipconfig`, re-run the firewall command in step 3, and make sure both machines are on the same home network

PropTradeBot says the token was refused	The token doesn't match `ptbbridge_token.txt`	Copy the token again (step 5)

Good to know

- The token travels unencrypted on your local network. That's normal for local trading tools, but only use this on a network you trust (your home network, not public Wi-Fi), and keep `allow_from=` to your Mac's address.
- The add-on's limits (`max_order_qty` , `max_position_qty` , `daily_loss_limit`) are a second safety net beside PropTradeBot's own. They hold even if PropTradeBot misbehaves.
- Only the stop rests at NinjaTrader. PropTradeBot fires its targets from NinjaTrader's live price, so you'll see one working stop order per trade and no resting target orders. That's by design.

Risk Disclosure: Futures and forex trading contains substantial risk and is not for every investor. An investor could potentially lose all or more than the initial investment. Risk capital is money that can be lost without jeopardizing one’s financial security or lifestyle. Only risk capital should be used for trading and only those with sufficient risk capital should consider trading. Past performance is not necessarily indicative of future results.

Hypothetical Performance Disclosure: Hypothetical performance results have many inherent limitations, some of which are described below. No representation is being made that any account will or is likely to achieve profits or losses similar to those shown; in fact, there are frequently sharp differences between hypothetical performance results and the actual results subsequently achieved by any particular trading program. One of the limitations of hypothetical performance results is that they are generally prepared with the benefit of hindsight. In addition, hypothetical trading does not involve financial risk, and no hypothetical trading record can completely account for the impact of financial risk of actual trading. For example, the

ability to withstand losses or to adhere to a particular trading program despite trading losses are material points that can also adversely affect actual trading results. There are numerous other factors related to the markets in general or to the implementation of any specific trading program that cannot be fully accounted for in the preparation of hypothetical performance results and all which can adversely affect trading results.
